

ABSTRACT

Whenever unauthorized entry occurs, the invention's alert system module works with the user's installed security surveillance system, which, in turn, joins up with that security surveillance system while dialing the user on his/her real-time wireless cellular-type phone or palm-held device . Upon full execution of the call, the invention feeds the user visual images, in real time, of activity inside or around their property with the ability for user to control security cameras, speakers and monitors in and/or around their property via their real-time wireless cellular-type phone or palm-held device.
